

Algorithm 1: In Silico Perturbation Trial (ISPT)

Input: graph G , targets T (nodes or edges)

Output: ranked interventions by ΔRisk

ΔR

```
r0 = f(G)    # baseline risk
```

```
for t in T:
```

```
    G' = intervene(G, t)      # cut edge / zero features
```

```
    r1 = f(G')
```

```
     $\Delta$  = r0 - r1
```

```
return sort_by( $\Delta$ , descending=True)
```
